1. Click on Start and then on Control Panel. Inside Control Panel you will find “Programs and Features”, as indicated in the red circle below. Click “Programs and Features”.

2. When the window opens you will see “Viewed installed updates”, which is circled in red in the graphic below. Click “View installed updates”.

3. A new view is now showing, this shows all of the updates installed on your computer. Scroll down until you find Office 2013. In that section you will see the 2 updates KB2810009 and KB2817630. Click on each one, one at a time, and then click uninstall. The two updates and the uninstall button are circled in red in the graphic below.
4. Reboot after the patches have been removed and Outlook should work just like normal.
